Customer Journey Map

Automated Network Request Management in ServiceNow

Date: 25 September 2026

SCENARIO Requesting, approving, tracking, and fulfilling network services digitally via ServiceNow	Entice How does Vishnu become aware of automated network services?		Enter What happens as he logs into Service Portal and submits a request?			Engage What happens in core approval & execution moments?			Exit What happens as ticket closes?	Extend What happens after fulfillment?
1 Steps What does Vishnu typically do?	**Notices Delays** Vishnu experiences slow network setup and pending email approvals.	**Learns of Portal** He learns network requests can be submitted via ServiceNow Service Portal (`/sp`).	**Opens Portal** He opens the ServiceNow Service Portal on his phone or workstation browser.	**Navigates Catalog** He navigates to Network category in Maintain Items and selects Network Request.	**Fills Details** He inputs connection type, justification, contact, and variables set information.	**Submits Form** He submits the form; auto-numbering assigns a unique Request Number (`u_database_table`).	**Flow Execution** Flow Designer triggers Get Catalog Variables, Creates Record & Asks for Approval.	**Receives Emails** Automated email notifications trigger to Manager / Security Approvers and requester.	**Fulfillment & Close** Network team completes port configuration, ticket auto-updates to Closed.	**Views Audit Trail** Vishnu reviews request status history, ACL access, and submits feedback on portal.
2 Interactions What touchpoints does he use at each step?	Email threads, colleague feedback	ServiceNow portal announcement banner	Service Portal `/sp` web interface	Service Catalog taxonomy, Network category	Dynamic form variables, UI Policies	`u_database_table`, auto-number prefix	Flow Designer logic engine	System Email Logs (Sent/Received)	Network Task (`u_network_task`)	My Requests Portal widget, Audit History
3 Goals & Motivations **4 Positive Moments**	**Avoid Manual Errors** Wants to avoid untracked email request chains.	**Find Self-Service** Sees that other IT departments use automated ServiceNow portals.	**Easy Access** Single Sign-On (SSO) login directly to Service Portal.	**Clear Categories** Simple navigation to Network Requests in Service Catalog.	**Auto-Populate Data** Mandatory fields and auto-filled requester information save time.	**Instant Tracking** Instant Request ID generated upon submission.	**Automated Routing** No manual intervention required to send approvals.	**Real-Time Alerts** Immediate email confirmation with approval progress links.	**Fast Provisioning** Standardized task generation speeds up fulfillment.	**Complete Record** Clear digital audit trail and security compliance logging.
5 Negative Moments What does he find frustrating?	Long waiting times for network access.	Uncertainty about required network parameters.	Forgetting portal URL path (`/sp`).	Selecting wrong connection type or category.	Incomplete form inputs blocking submission.	Worry about request rejection or misrouting.	Delayed approver response on critical tasks.	Email notifications going to spam folder.	Technical issues during network port provisioning.	Lack of clarity on post-fulfillment support.
6 Areas of Opportunity Ideas to improve each step?	Promote ServiceNow Service Catalog on intranet.	Provide catalog search tags for quick discovery.	Add quick-link bookmark on employee homepage.	Add tooltips explaining network connection types.	Implement dynamic Client Scripts for auto-filling.	Display estimated completion time upon submit.	Add auto-escalation timer logic in Flow Designer.	Configure branded HTML email templates.	Integrate auto-provisioning via Ansible / Cisco DNA.	Add automated satisfaction survey widget on close.

Persona: Bellapu Vishnu Vardhan, Enterprise Requester & IT Admin

Based on the Problem Statements, Empathy Map and Brainstorming documents of this project.

Persona and pain points are taken from the project's Empathy Map (Automated Network Request Management in ServiceNow).
